5	Session Information	14

1 Introduction

The *GenomeInfoDb* provides an interface to access seqlevelsStyles (such as UCSC, NCBI, Ensembl) and their supported mappings for organisms. For instance, for *Homo sapiens*, seqlevelsStyle "UCSC" maps to "chr1", "chr2", ..., "chrX", "chrY". The section below introduces these functions with examples.

2 Functionality for all existing organisms

2.1 genomeStyles

The `genomeStyles` lists out for each organism, the seqlevelsStyles and their mappings.

```
seqmap <- genomeStyles()

## Warning in scan(file = file, what = what, sep = sep, quote = quote, dec = dec,
: EOF within quoted string

head(seqmap, n=2)

## $Arabidopsis_thaliana
##   circular auto sex NCBI TAIR9 Ensembl
## 1 FALSE TRUE FALSE 1 Chr1 1
## 2 FALSE TRUE FALSE 2 Chr2 2
## 3 FALSE TRUE FALSE 3 Chr3 3
## 4 FALSE TRUE FALSE 4 Chr4 4
## 5 FALSE TRUE FALSE 5 Chr5 5
## 6 TRUE FALSE FALSE MT ChrM Mt
## 7 TRUE FALSE TRUE Pltd ChrC Pt
##
## $Caenorhabditis_elegans
##   circular auto sex NCBI UCSC Ensembl
## 1 FALSE TRUE FALSE I chrI I
## 2 FALSE TRUE FALSE II chrII II
## 3 FALSE TRUE FALSE III chrIII III
## 4 FALSE TRUE FALSE IV chrIV IV
## 5 FALSE TRUE FALSE V chrV V
## 6 FALSE FALSE TRUE X chrX X
## 7 TRUE TRUE FALSE MT chrM MtDNA
```

Organism's supported by GenomeInfoDb can be found by :

```
names(genomeStyles())

## Warning in scan(file = file, what = what, sep = sep, quote = quote, dec = dec,
: EOF within quoted string

## [1] "Arabidopsis_thaliana"      "Caenorhabditis_elegans"
## [3] "Canis_familiaris"         "Cyanidioschyzon_merolae"
## [5] "Drosophila_melanogaster"   "Homo_sapiens"
## [7] "Mus_musculus"              "Oryza_sativa"
```

An Introduction to *GenomeInfoDb*

```
## [9] "Populus_trichocarpa"      "README"
## [11] "Rattus_norvegicus"        "Saccharomyces_cerevisiae"
## [13] "Zea_mays"                 "genomeMappingTbl.csv"
```

If one knows the organism one is interested in, then we can directly access the information for the given organism along. Each function accepts an argument called species which as "genus species", the default is "Homo sapiens". In the following example we list out only the first five entries returned by the code snippet.

```
head(genomeStyles("Homo_sapiens"),5)
##   circular auto  sex NCBI UCSC dbSNP Ensembl
## 1 FALSE TRUE FALSE 1 chr1 ch1 1
## 2 FALSE TRUE FALSE 2 chr2 ch2 2
## 3 FALSE TRUE FALSE 3 chr3 ch3 3
## 4 FALSE TRUE FALSE 4 chr4 ch4 4
## 5 FALSE TRUE FALSE 5 chr5 ch5 5
```

We can also check if a given style is supported by GenomeInfoDb for a given species. For example, if we want to know if "UCSC" mapping is supported for "Homo sapiens" we can ask :

```
"UCSC" %in% names(genomeStyles("Homo_sapiens"))
## [1] TRUE
```

2.2 extractSeqlevels

We can also extract the desired seqlevelsStyle from a given organism using the `extractSeqlevels`

```
extractSeqlevels(species="Arabidopsis_thaliana", style="NCBI")
## [1] "1"    "2"    "3"    "4"    "5"    "MT"   "Pltd"
```

2.3 extractSeqlevelsByGroup

We can also extract the desired seqlevelsStyle from a given organism based on a group (Group - 'auto' denotes autosomes, 'circular' denotes circular chromosomes and 'sex' denotes sex chromosomes; the default is all chromosomes are returned).

```
extractSeqlevelsByGroup(species="Arabidopsis_thaliana", style="NCBI",
                        group="auto")
## [1] "1" "2" "3" "4" "5"
```

2.4 seqlevelsStyle

We can find the seqname Style for a given character vector by using the `seqlevelsStyle`

```
seqlevelsStyle(paste0("chr",c(1:30)))  
## Warning in scan(file = file, what = what, sep = sep, quote = quote, dec = dec,  
: EOF within quoted string  
## [1] "UCSC"  
  
seqlevelsStyle(c("2L","2R","X","Xhet"))  
## Warning in scan(file = file, what = what, sep = sep, quote = quote, dec = dec,  
: EOF within quoted string  
## [1] "NCBI"
```

2.5 seqlevelsInGroup

We can also subset a given character vector containing seqnames using the `seqlevelsInGroup`. We currently support 3 groups: 'auto' for autosomes, 'sex' for allosomes/sex chromosomes and circular for 'circular' chromosomes. The user can also provide the style and species they are working with. In the following examples, we extract the sex, auto and circular chromosomes for *Homo sapiens* :

```
newchr <- paste0("chr",c(1:22,"X","Y","M","1_gl000192_random","4_ctg9_hap1"))  
seqlevelsInGroup(newchr, group="sex")  
## Warning in scan(file = file, what = what, sep = sep, quote = quote, dec = dec,  
: EOF within quoted string  
## [1] "chrX" "chrY"  
  
seqlevelsInGroup(newchr, group="auto")  
## Warning in scan(file = file, what = what, sep = sep, quote = quote, dec = dec,  
: EOF within quoted string  
## [1] "chr1" "chr2" "chr3" "chr4" "chr5" "chr6" "chr7" "chr8" "chr9"  
## [10] "chr10" "chr11" "chr12" "chr13" "chr14" "chr15" "chr16" "chr17" "chr18"  
## [19] "chr19" "chr20" "chr21" "chr22"  
  
seqlevelsInGroup(newchr, group="circular")  
## Warning in scan(file = file, what = what, sep = sep, quote = quote, dec = dec,  
: EOF within quoted string  
## [1] "chrM"  
  
seqlevelsInGroup(newchr, group="sex", "Homo_sapiens", "UCSC")  
## [1] "chrX" "chrY"
```

if we have a vector containing seqnames and we want to verify the species and style for them , we can use:

```
seqnames <- c("chr1", "chr9", "chr2", "chr3", "chr10")  
all(seqnames %in% extractSeqlevels("Homo_sapiens", "UCSC"))  
## [1] TRUE
```

2.6 orderSeqlevels

The `orderSeqlevels` can return the order of a given character vector which contains seqnames. In the following example, we show how you can find the order for a given seqnames character vector.

```
seqnames <- c("chr1", "chr9", "chr2", "chr3", "chr10")
orderSeqlevels(seqnames)

## [1] 1 3 4 2 5

seqnames[orderSeqlevels(seqnames)]

## [1] "chr1"  "chr2"  "chr3"  "chr9"  "chr10"
```

2.7 rankSeqlevels

The `rankSeqlevels` can return the rank of a given character vector which contains seqnames. In the following example, we show how you can find the rank for a given seqnames character vector.

```
seqnames <- c("chr1", "chr9", "chr2", "chr3", "chr10")
rankSeqlevels(seqnames)

## [1] 1 4 2 3 5
```

2.8 mapSeqlevels

Returns a matrix with 1 column per supplied sequence name and 1 row per sequence renaming map compatible with the specified style. If `best.only` is TRUE (the default), only the "best" renaming maps (i.e. the rows with less NAs) are returned.

```
mapSeqlevels(c("chrII", "chrIII", "chrM"), "NCBI")

## Warning in scan(file = file, what = what, sep = sep, quote = quote, dec = dec,
: EOF within quoted string

## chrII chrIII chrM
## "II"   "III"   "MT"
```

We also have several seqlevel utility functions. Let us construct a basic GRanges and show how these functions can be used. .

```
gr <- GRanges(paste0("ch", 1:35), IRanges(1:35, width=5))
gr

## GRanges object with 35 ranges and 0 metadata columns:
##           seqnames      ranges strand
##           <Rle> <IRanges>  <Rle>
## [1]     ch1      1-5      *
## [2]     ch2      2-6      *
## [3]     ch3      3-7      *
## [4]     ch4      4-8      *
```

```
## [5] ch5      5-9    *
## ...   ...     ...    ...
## [31] ch31    31-35   *
## [32] ch32    32-36   *
## [33] ch33    33-37   *
## [34] ch34    34-38   *
## [35] ch35    35-39   *
## -----
## seqinfo: 35 sequences from an unspecified genome; no seqlengths
```

As you can see , we have "ch" instead of "chr" for chromosome names. We can use `renameSeqlevels` to change the "ch" to "chr"

2.9 renameSeqlevels

As the first argument - it takes the object whose seqlevels we need to change, and as the second argument it takes a named vector which has the changes.

```
newnames <- paste0("chr",1:35)
names(newnames) <- paste0("ch",1:35)
head(newnames)

##    ch1    ch2    ch3    ch4    ch5    ch6
## "chr1" "chr2" "chr3" "chr4" "chr5" "chr6"

gr <- renameSeqlevels(gr,newnames)
gr

## GRanges object with 35 ranges and 0 metadata columns:
##           seqnames      ranges strand
##                 <Rle> <IRanges> <Rle>
## [1]     chr1      1-5    *
## [2]     chr2      2-6    *
## [3]     chr3      3-7    *
## [4]     chr4      4-8    *
## [5]     chr5      5-9    *
## ...
## [31]    chr31    31-35   *
## [32]    chr32    32-36   *
## [33]    chr33    33-37   *
## [34]    chr34    34-38   *
## [35]    chr35    35-39   *
## -----
## seqinfo: 35 sequences from an unspecified genome; no seqlengths
```

Humans have just 22 primary chromosomes - but here we have some extra seqlevels which we want to remove - there are several ways we can achieve this:

2.10 dropSeqlevels

Here the second argument is the seqlevels that you want to drop. Because these seqlevels are in use (i.e. have ranges on them), the ranges on these sequences need to be removed before the seqlevels can be dropped. We call this *pruning*. The `pruning.mode` argument controls how to prune `gr`. Unlike for list-like objects (e.g. `GRangesList`) for which pruning can be done in various ways, pruning a `GRanges` object is straightforward and achieved by specifying `pruning.mode="coarse"`.

```
dropSeqlevels(gr, paste0("chr", 23:35), pruning.mode="coarse")

## GRanges object with 22 ranges and 0 metadata columns:
##      seqnames      ranges strand
##          <Rle> <IRanges> <Rle>
## [1] chr1      1-5      *
## [2] chr2      2-6      *
## [3] chr3      3-7      *
## [4] chr4      4-8      *
## [5] chr5      5-9      *
## ...
## [18] chr18     18-22    *
## [19] chr19     19-23    *
## [20] chr20     20-24    *
## [21] chr21     21-25    *
## [22] chr22     22-26    *
## -----
## seqinfo: 22 sequences from an unspecified genome; no seqlengths
```

2.11 keepSeqlevels

Here the second argument is the seqlevels that you want to keep.

```
keepSeqlevels(gr, paste0("chr", 1:22), pruning.mode="coarse")

## GRanges object with 22 ranges and 0 metadata columns:
##      seqnames      ranges strand
##          <Rle> <IRanges> <Rle>
## [1] chr1      1-5      *
## [2] chr2      2-6      *
## [3] chr3      3-7      *
## [4] chr4      4-8      *
## [5] chr5      5-9      *
## ...
## [18] chr18     18-22    *
## [19] chr19     19-23    *
## [20] chr20     20-24    *
## [21] chr21     21-25    *
## [22] chr22     22-26    *
## -----
## seqinfo: 22 sequences from an unspecified genome; no seqlengths
```

2.12 keepStandardChromosomes

This function internally uses the pre-defined tables inside GenomeInfoDb to find the correct seqlevels according to the sequence style of the object.

```
keepStandardChromosomes(gr, pruning.mode="coarse")

## Warning in scan(file = file, what = what, sep = sep, quote = quote, dec = dec,
: EOF within quoted string

## Warning in scan(file = file, what = what, sep = sep, quote = quote, dec = dec,
: EOF within quoted string

## GRanges object with 35 ranges and 0 metadata columns:
##      seqnames      ranges strand
##              <Rle> <IRanges>  <Rle>
## [1] chr1      1-5      *
## [2] chr2      2-6      *
## [3] chr3      3-7      *
## [4] chr4      4-8      *
## [5] chr5      5-9      *
## ...
## [31] chr31     31-35    *
## [32] chr32     32-36    *
## [33] chr33     33-37    *
## [34] chr34     34-38    *
## [35] chr35     35-39    *
## -----
## seqinfo: 35 sequences from an unspecified genome; no seqlengths
```

One can also specify the optional species argument to be more precise.

```
plantgr <- GRanges(c(1:5,"MT","Pltd"), IRanges(1:7,width=5))
keepStandardChromosomes(plantgr, species="Arabidopsis thaliana",
                       pruning.mode="coarse")

## Warning in scan(file = file, what = what, sep = sep, quote = quote, dec = dec,
: EOF within quoted string

## GRanges object with 7 ranges and 0 metadata columns:
##      seqnames      ranges strand
##              <Rle> <IRanges>  <Rle>
## [1]      1      1-5      *
## [2]      2      2-6      *
## [3]      3      3-7      *
## [4]      4      4-8      *
## [5]      5      5-9      *
## [6]      MT     6-10     *
## [7]      Pltd   7-11     *
## -----
## seqinfo: 7 sequences from an unspecified genome; no seqlengths
```

3 Classes inside GenomeInfoDb package

3.1 Genome-Description class

We also provide a Genome Description class which can be used in the following way:

```
library(BSgenome.Celegans.UCSC.ce2)
class(Celegans)

## [1] "BSgenome"
## attr(,"package")
## [1] "BSgenome"

is(Celegans, "GenomeDescription")

## [1] TRUE

provider(Celegans)

## [1] "UCSC"

seqinfo(Celegans)

## Seqinfo object with 7 sequences (1 circular) from ce2 genome:
##   seqnames seqlengths isCircular genome
##   chrI      15080483    FALSE   ce2
##   chrII     15279308    FALSE   ce2
##   chrIII    13783313    FALSE   ce2
##   chrIV     17493791    FALSE   ce2
##   chrV      20922231    FALSE   ce2
##   chrX      17718849    FALSE   ce2
##   chrM      13794      TRUE    ce2

gendesc <- as(Celegans, "GenomeDescription")
class(gendesc)

## [1] "GenomeDescription"
## attr(,"package")
## [1] "GenomeInfoDb"

gendesc

## | organism: Caenorhabditis elegans (Worm)
## | provider: UCSC
## | provider version: ce2
## | release date: Mar. 2004
## | release name: WormBase v. WS120
## | ---
## | seqlengths:
## |   chrI   chrII   chrIII   chrIV   chrV   chrX   chrM
## |   15080483 15279308 13783313 17493791 20922231 17718849 13794

provider(gendesc)

## [1] "UCSC"

seqinfo(gendesc)
```

An Introduction to *GenomeInfoDb*

```
## Seqinfo object with 7 sequences (1 circular) from ce2 genome:  
## seqnames seqlengths isCircular genome  
## chrI      15080483    FALSE   ce2  
## chrII     15279308    FALSE   ce2  
## chrIII    13783313    FALSE   ce2  
## chrIV     17493791    FALSE   ce2  
## chrV      20922231    FALSE   ce2  
## chrX      17718849    FALSE   ce2  
## chrM      13794      TRUE    ce2  
  
bsgenomeName(gendesc)  
## [1] "BSgenome.Celegans.UCSC.ce2"
```

3.2 Seqinfo class

```
## Note that all the arguments (except 'genome') must have the  
## same length. 'genome' can be of length 1, whatever the lengths  
## of the other arguments are.  
x <- Seqinfo(seqnames=c("chr1", "chr2", "chr3", "chrM"),  
             seqlengths=c(100, 200, NA, 15),  
             isCircular=c(NA, FALSE, FALSE, TRUE),  
             genome="toy")  
length(x)  
## [1] 4  
seqnames(x)  
## [1] "chr1" "chr2" "chr3" "chrM"  
names(x)  
## [1] "chr1" "chr2" "chr3" "chrM"  
seqlevels(x)  
## [1] "chr1" "chr2" "chr3" "chrM"  
seqlengths(x)  
## chr1 chr2 chr3 chrM  
## 100 200 NA 15  
isCircular(x)  
## chr1 chr2 chr3 chrM  
## NA FALSE FALSE TRUE  
genome(x)  
## chr1 chr2 chr3 chrM  
## "toy" "toy" "toy" "toy"  
x[c("chrY", "chr3", "chr1")] # subset by names
```

An Introduction to *GenomeInfoDb*

```
## Seqinfo object with 3 sequences from 2 genomes (NA, toy):
##   seqnames seqlengths isCircular genome
##   chrY         NA         NA    <NA>
##   chr3         NA        FALSE    toy
##   chr1        100        NA    toy

## Rename, drop, add and/or reorder the sequence levels:
xx <- x
seqlevels(xx) <- sub("chr", "ch", seqlevels(xx)) # rename
xx

## Seqinfo object with 4 sequences (1 circular) from toy genome:
##   seqnames seqlengths isCircular genome
##   ch1        100        NA    toy
##   ch2        200        FALSE   toy
##   ch3         NA        FALSE   toy
##   chM         15        TRUE   toy

## chrM          15      TRUE    toy
## chr4          NA       NA <NA>

suppressWarnings(merge(x, y))

## Seqinfo object with 5 sequences (1 circular) from 2 genomes (toy, NA):
## seqnames seqlengths isCircular genome
## chr1          100      NA    toy
## chr2          200     FALSE   toy
## chr3          300     FALSE   toy
## chrM          15      TRUE    toy
## chr4          NA       NA <NA>

## Note that, strictly speaking, merging 2 Seqinfo objects is not
## a commutative operation, i.e., in general 'z1 <- merge(x, y)'
## is not identical to 'z2 <- merge(y, x)'. However 'z1' and 'z2'
## are guaranteed to contain the same information (i.e. the same
## rows, but typically not in the same order):
suppressWarnings(merge(y, x))

## Seqinfo object with 5 sequences (1 circular) from 2 genomes (toy, NA):
## seqnames seqlengths isCircular genome
## chr3          300     FALSE   toy
## chr4          NA      NA <NA>
## chrM          15      TRUE    toy
## chr1          100     NA    toy
## chr2          200     FALSE   toy

## This contradicts what 'x' says about circularity of chr3 and chrM:
isCircular(y)[c("chr3", "chrM")] <- c(TRUE, FALSE)
y

## Seqinfo object with 3 sequences (1 circular) from an unspecified genome:
## seqnames seqlengths isCircular genome
## chr3          300      TRUE   <NA>
## chr4          NA       NA <NA>
## chrM          15      FALSE   <NA>

if (interactive()) {
  merge(x, y) # raises an error
}
```

4 Examples

4.1 converting seqlevel styles (eg:UCSC to NCBI)

A quick example using *Drosophila Melanogaster*. The txdb object contains seqlevels in UCSC style, we want to convert them to NCBI

```
txdb <- TxDb.Dmelanogaster.UCSC.dm3.ensGene
seqlevels(txdb)

## [1] "chr2L"      "chr2R"       "chr3L"       "chr3R"       "chr4"       "chrX"
## [7] "chrU"        "chrM"        "chr2LHet"    "chr2RHet"    "chr3LHet"    "chr3RHet"
## [13] "chrXHet"    "chrYHet"    "chrUextra"

genomeStyles("Drosophila melanogaster")

##   circular  sex  auto  NCBI      UCSC          Ensembl
## 1 FALSE FALSE TRUE  2L chr2L           2L
## 2 FALSE FALSE TRUE  2R chr2R           2R
## 3 FALSE FALSE TRUE  3L chr3L           3L
## 4 FALSE FALSE TRUE  3R chr3R           3R
## 5 FALSE FALSE TRUE    4 chr4            4
## 6 FALSE  TRUE FALSE   X chrX            X
## 7 FALSE  TRUE FALSE   Y chrY            Y
## 8  TRUE FALSE FALSE  MT chrM dmel_mitochondrion_genome
## 9 FALSE FALSE FALSE 2LHet chr2LHet        2LHet
## 10 FALSE FALSE FALSE 2RHet chr2RHet        2RHet
## 11 FALSE FALSE FALSE 3LHet chr3LHet        3LHet
## 12 FALSE FALSE FALSE 3RHet chr3RHet        3RHet
## 13 FALSE FALSE FALSE Xhet chrXHet         XHet
## 14 FALSE FALSE FALSE Yhet chrYHet         YHet
## 15 FALSE FALSE FALSE Un  chrU             U
## 16 FALSE FALSE FALSE <NA> chrUextra       Uextra

mapSeqlevels(seqlevels(txdb), "NCBI")

## Warning in scan(file = file, what = what, sep = sep, quote = quote, dec = dec,
: EOF within quoted string

##   chr2L     chr2R     chr3L     chr3R     chr4     chrX     chrU
##   "2L"     "2R"     "3L"     "3R"     "4"     "X"     "Un"
##   chrM   chr2LHet  chr2RHet  chr3LHet  chr3RHet  chrXHet  chrYHet
##   "MT"   "2LHet"  "2RHet"  "3LHet"  "3RHet"  "Xhet"  "Yhet"
## chrUextra
##      NA
```

4.2 converting styles and removing unwanted seqlevels

Suppose we read in a Bam file or a BED file and the resulting GRanges have a lot of seqlevels which are not required by your analysis or you want to rename the seqlevels from the current style to your own style (eg:UCSC to NCBI), we can use the functionality provided by *GenomeInfoDb* to do that.

An Introduction to *GenomeInfoDb*

Let us say that we have extracted the seqlevels of the Seqinfo object(say GRanges from a BED file) in a variable called "sequence".

```
sequence <- seqlevels(x)

## sequence is in UCSC format and we want NCBI style
newStyle <- mapSeqlevels(sequence, "NCBI")
newStyle <- newStyle[complete.cases(newStyle)] # removing NA cases.

## rename the seqlevels
x <- renameSeqlevels(x,newStyle)

## keep only the seqlevels you want (say autosomes)
auto <- extractSeqlevelsByGroup(species="Homo sapiens", style="NCBI",
                                 group="auto")
x <- keepSeqlevels(x,auto)
```

5 Session Information

Here is the output of `sessionInfo` on the system on which this document was compiled:

```
toLatex(sessionInfo())
```
